## American Cancer Society Kicks Off Colorectal Cancer Awareness Month with New Cancer Risk Assessment Tool

The new educational resource empowers individuals with personalized recommendations to reduce cancer risk and support overall health.

ATLANTA, March 3, 2025 — According to the American Cancer Society's recently released Cancer Facts & Figures 2025 report, colorectal cancer (CRC) is the leading cause of cancer death for men under 50, and the second leading cause of cancer death for women in the same age group. While there is no guaranteed way to prevent colorectal cancer, individuals may be able to lower their risk by addressing factors that can be controlled. That is why the American Cancer Society is highlighting its new comprehensive cancer risk assessment tool, CancerRisk360, during Colorectal Cancer Awareness Month.

CancerRisk360 provides individuals with an accessible, easy first step to prevent and detect cancer by offering a better understanding of several factors that impact a person's individual risk. Through the 5-10-minute CancerRisk360 assessment, individuals answer questions in four key areas:

- Genetic and hereditary markers
- · Family history of cancer
- Adherence to evidence-based cancer screening guidelines
- Daily life factors, including tobacco use, alcohol consumption, diet, physical activity, and body weight

The assessment also includes questions about unique colorectal cancer risk factors, including irritable bowel syndrome and family or personal history of polyps. After completing the assessment, individuals receive a personalized report with recommendations on how to reduce their risk, and as appropriate, guidance on when to get screened.

"Understanding risk and getting screened are our greatest defenses against cancer," said <u>Dr. Arif Kamal</u>, chief patient officer at the American Cancer Society. "We recognize that screening guidelines can be complex and ever-changing. As we kick off Colorectal Cancer Awareness Month, CancerRisk360 is a crucial tool in simplifying understanding one's personal risk. Our hope is that this tool not only educates, but also encourages people to take proactive steps —whether that means modifying lifestyle habits or speaking with a doctor about screening options."

When colorectal cancer is detected at an early stage before it has spread, the 5-year relative survival rate is about 90% (<u>source</u>). However, only about 20% of people ages 45-49 are getting screened (<u>source</u>). Here's the bottom line: with rising diagnoses among adults younger than 65, early risk assessment and detection remain the best ways to improve health outcomes.

"Our guidelines recommend that individuals at average risk start regular colorectal cancer screening at age 45. Several test options are available, including colonoscopies—considered the gold standard—and stool-based athome tests," said Kamal.

In addition to the CancerRisk360 assessment, the American Cancer Society continues to promote its "I Love You, Get Screened" campaign, encouraging people to talk to their loved ones about cancer screening.

CancerRisk360 prioritizes published, guideline-driven recommendations and is intended to be used for general information only and not intended to replace professional medical advice.
