

# What You Need to Know About Cardiovascular Disease and Cancer

## During American Heart Month, the American Cancer Society stresses prevention to help lower the chance of heart disease for people with cancer

ATLANTA, February 15, 2023 — [American Cancer Society](#) (ACS) research estimates there are more than [18 million adult survivors of cancer](#) in the United States, and that number is expected to climb to more than 22 million by 2030. Although that's encouraging news, it also puts increasing numbers of survivors at risk for cardiovascular disease or CVD. A recent [study](#) found adult survivors of cancer had a 42% greater risk of CVD than people without cancer. The authors found that survivors of cancer had a particularly higher risk of developing heart failure (52% higher risk), followed by stroke (22% higher risk). The incidence of CVD was highest in survivors who had breast, lung, and hematological/lymphatic cancers. With February designated as American Heart Month, it's a good reminder for people with cancer to monitor their cardiovascular health.

"Treatments for cancer, like radiation and chemotherapy, can help people live longer. However, certain treatments have potential side effects, including new or worsening heart disease," says [Dr. Arif Kamal](#), chief patient officer at the American Cancer Society. "The type of damage to your heart and the risk of causing a problem can vary depending on the therapy, but it's a real health risk that is oftentimes neglected."

Heart conditions that can develop or worsen after cancer treatment are:

- Congestive heart failure
- Coronary artery disease
- Cardiomyopathy
- Damage to heart valves
- Myocarditis (Inflammation of the heart muscle)
- High blood pressure

CVD affecting people with cancer has led to the increase of cardio-oncology as a subspecialty of medicine. Cardio-oncology focuses on identifying, monitoring, and treating cardiovascular diseases caused by cancer treatment. The goal is to reduce the side effects cancer treatment can have on a person's cardiovascular system. Cardio-oncologists collaborate with other healthcare providers to tailor treatment and care to your needs.

"Cancer survivors are a high-risk population and should be prioritized for interventions that lower the chance of heart disease later in life," said Kamal. "Health care providers need to actively reinforce the importance of prevention against CVD."

Sometimes cancer-related side effects and symptoms don't show up until long after treatment ends. Whether you're still in treatment, recently completed it, or long since finished, be sure you're getting follow-up care and doing everything you can to safeguard your health. The ACS has information to help you take steps to protect your health, including:

- [Avoiding tobacco products](#)
- [Getting to and staying at a healthy weight](#)
- [Getting regular exercise](#)
- [Eating a healthy diet](#)
- [Avoiding or minimizing alcohol use](#)
- [Getting recommended cancer screenings](#)
- [Creating a survivorship care plan](#)
- [Keeping your follow-up appointments](#)
- [Taking care of your emotional health](#)

Kamal also recommends working with your cancer care team to find out whether your treatment can cause any

heart-related problems. If so, there are often ways to help lower the risk.

### **About the American Cancer Society**

The American Cancer Society is a leading cancer-fighting organization with a vision to end cancer as we know it, for everyone. For more than 100 years, we have been improving the lives of people with cancer and their families as the only organization combating cancer through advocacy, research, and patient support. We are committed to ensuring everyone has an opportunity to prevent, detect, treat, and survive cancer. To learn more, visit [cancer.org](https://cancer.org) or call our 24/7 helpline at 1-800-227-2345. Connect with us on [Facebook](#), [Twitter](#), and [Instagram](#).
